2. Wound-Care-Center in Southern Switzerland

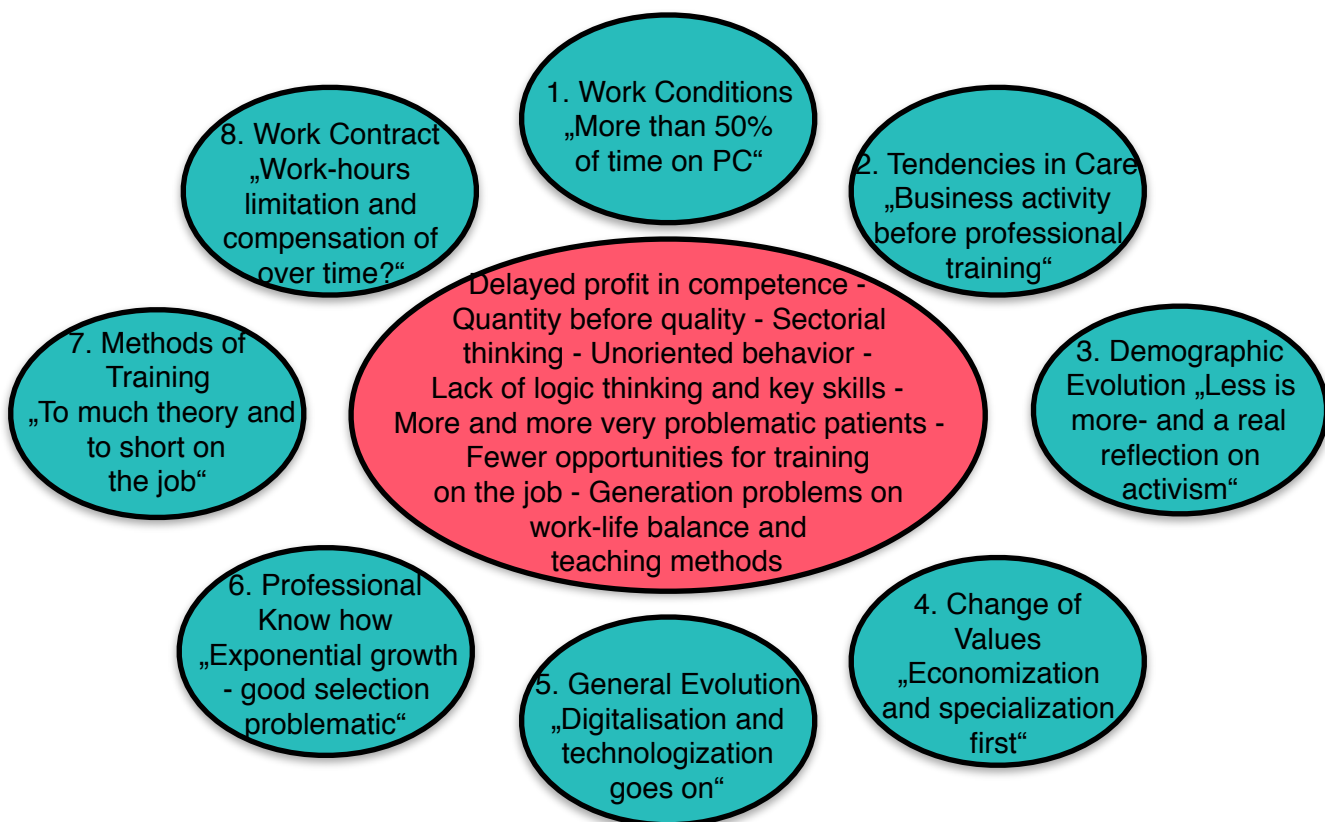

## Introduction

... or are we offering short circuit masking inadequately professional formation?

Guarantees a good intention also a good result?

We are living now a time period of rapid change, a matter of challenge and a quest of competence, what means logic behavior, problem solving and mastery of new knowledge.

## Arguments and Consequences

## Conclusion

For developing professional key skill we need **reflections** and **conceptional thinking** today difficult to transfer with obligatory training methods - yet also basic for the realization of **choosing wisely**, otherwise we are losing the embedded benefit. We end with a new proposal: Can choosing wisely stimulate a change of paradigma in training ? (Horizontal learning instead of vertical training)
